INTRODUCTION

Seeking to better understand and address state Title V Maternal and Child Health (MCH) and Children and Youth with Special Health Care Needs (CYSHCN) workforce and leadership needs, the Association of Maternal and Child Health Programs (AMCHP) and the Association of Teachers of Maternal and Child Health (ATMCH), with support from the Maternal and Child Health Bureau (MCHB) surveyed these programs between May and August 2008. Both programs in all 59 jurisdictions were requested to complete a web-based survey instrument that would provide a national profile of the state programs’ components and functions, and would indicate priority needs and preferred strategies with respect to workforce development. All 50 states and the District of Columbia provided at least one program response; of these, 49 MCH (96 percent) and 44 CYSHCN (86 percent) programs completed the survey. Four of the eight U.S. territories completed the survey.¹

This document presents preliminary descriptive data from selected portions of the survey. It presents state Title V program training needs as well as their strategies, preferences and barriers for providing professional development/continuing education and formal graduate education for program staff.

Other profiles of state MCH and CYSHCN program activity areas, functions and leadership, and of professional development strategies, preferences and barriers are available. Analyses and reports will be available in the coming months which will present the survey findings in their entirety and analysis of regional issues. AMCHP, ATMCH and MCHB will continue to partner with state Title V agencies and training programs to understand the data and apply the findings to address workforce and training needs.

## Training Needs

State programs indicated a range of training needs within six specific competency areas: public health/Title V knowledge base, communication, critical thinking, management, family-centered care and the medical home, and leadership development. As many of these answers were similar between MCH and CYSHCN programs, average responses for the two were combined and then ranked (Table 1). Of particular note, critical thinking skills and other skills relevant to translating new science and using data for planning and implementing policies and programs were highlighted in states’ responses for three separate domains. In only one area (family-centered care and the medical home) were differences between the programs markedly different. Specifically, MCH programs were more likely than CYSHCN programs (59 versus 48 percent) to identify ‘solicit and use family partnerships in a meaningful way in the design or delivery of clinical services, program planning and evaluation’ as a need. In addition, MCH programs were less likely than CYSHCN programs (57 versus 70 percent) to identify ‘strategies for incorporating family centered and medical home models of healthcare into health professions and continuing education curricula’ as a training need.

Respondents also indicated the top three knowledge or skills areas for which they felt the greatest need for staff training exist (Figure 1). The majority of both MCH and CYSHCN respondents listed critical thinking and leadership development, and roughly half of both types of respondents indicated management training.

Training to improve staff’s knowledge base on public health/Title V was listed as a top need among 41 percent of MCH programs and about half of the responding CYSHCN programs. Training on communication and on family centered care/medical home were less frequently listed (33 and 22 percent of MCH programs, and 39 and 32 percent of CYSHCN programs, respectively). Only one CYSHCN respondent indicated that there are no major training needs for staff in the state.

Within the territories, three-fourths of MCH programs reported needing training in leadership development, public health/Title V knowledge base, and management. All CYSHCN programs in the territories reported needing leadership development, and two-thirds reported needing training on the public health/Title V knowledge base, critical thinking, and management.

## Continuing Education/Professional Development

### Strategies:
Most Title V programs use a variety of strategies to provide and/or facilitate professional...
development/continuing education training for their state level program staff (Figure 2).

Within the territories, most MCH and CYSHCN programs provide training on-site, pay travel costs to attend trainings (both in-state and out-of-state), provide release time with pay, and make online courses available to staff.

Preferences: As shown on Figure 3, the method of training most preferred by state level Title V staff is attending national conferences or meetings and, in particular, skills building sessions (63 percent). The second most popular method is regional meetings/trainings with multiple states (59 percent).

Within the territories, the majority of both Title V programs reported that 1-3 day intensive training sessions with 25-50 trainees are preferred, as are national conferences or meetings with skills building sessions.

Barriers: The three most important barriers to providing training to Title V staff are travel restrictions, difficulties taking time away from work, and the costs of continuing education programs (Table 2). Few state programs reported that they face no barriers.

Within the territories, the most important barriers among Title V programs are the costs of continuing education programs, limited geographic access, and a lack of appropriate continuing education offerings.

Graduate Education

Strategies: As shown on Figure 4, most Title V programs reported using at least one strategy to provide and/or facilitate formal graduate education for their full or part time state level program staff, although a few reported none (12 percent of MCH programs and 20 percent of CYSHCN programs). On average, each type of state program only uses two strategies to promote graduate education. The predominant methods used among both MCH and CYSHCN programs are giving staff flexible hours to pursue education and paying or reimbursing tuition costs.

Within the territories, the most common strategy used is release time without pay (half of MCH programs and two-thirds of CYSHCN programs). Half of MCH programs in the territories also provide staff with flexible hours to pursue education; all other strategies are rarely used by either program.

Preferences: As shown on Figure 4, when state level program staff has the opportunity to pursue graduate education, the method preferred most by both MCH and CYSHCN staff is a blended learning program incorporating both on site and distance courses. Part time on-campus graduate education and part time distance learning courses also are popular.

Within the territories, the majority of both MCH and CYSHCN programs report that blended learning programs, and part time distance education are the preferred methods.

Barriers: Eleven percent of Title V programs (four percent of MCH and 18 percent of CYSHCN) do not face barriers to providing graduate education for their staff (Table 3). However, most programs identified at least one barrier, and the two most important barriers cited are lack of career promotion opportunities and a lack of support (financial, logistical) from the state agency.

All MCH and CYSHCN programs responding from the territories reported that a lack of support from the state agency is a barrier. Half of MCH programs in the territories reported that a lack of career promotion opportunities, the agency not valuing graduate education and structural barriers in institutes of higher learning are some of the greatest problems they face. Two-thirds of CYSHCN programs in the territories also cited a lack of career promotion opportunities and structural barriers in institutes of higher learning (e.g., no part-time academic degree programs) as problems.

ACKNOWLEDGEMENT

This project was partially supported through HRSA Grant U01MC00001 to the Association of Maternal and Child Health Programs (AMCHP). Survey development and analysis were supported through AMCHP membership dues. This project received study approval by University of Illinois Office for the Protection of Research Subjects (#2007-0842). AMCHP appreciates the contributions of Alyssa Sharkey, Jenelle Partelow, and Holly Grason, Johns Hopkins Bloomberg School of Public Health to this profile, and the efforts of the AMCHP Workforce Development Committee who assisted with the survey design and guided presentation of these results. AMCHP is also appreciative of the state Title V programs for completing the survey.

1Three territories provided responses for both MCH and CYSHCN programs and one territory provided a response for MCH only.

OUR MISSION

AMCHP supports state maternal and child health programs and provides national leadership on issues affecting women and children.
